"SHE'S JUST HORMONAL": COMMON MISCONCEPTIONS ABOUT PREMENSTRUAL MOOD SYNDROMES

RACHEL LEMALEFANT, MD UNIVERSITY OF WASHINGTON CONSULTATION-LIAISON PSYCHIATRY FELLOW

SPEAKER DISCLOSURES

No conflicts of interest to disclose

PLANNER DISCLOSURES

The following series planners have no relevant conflicts of interest to disclose; other disclosures have been mitigated.

Mark Duncan MD Rick Ries MD Kari Stephens PhD Barb McCann PhD Anna Ratzliff MD PhD Betsy Payn MA PMP Esther Solano Cara Towle MSN RN

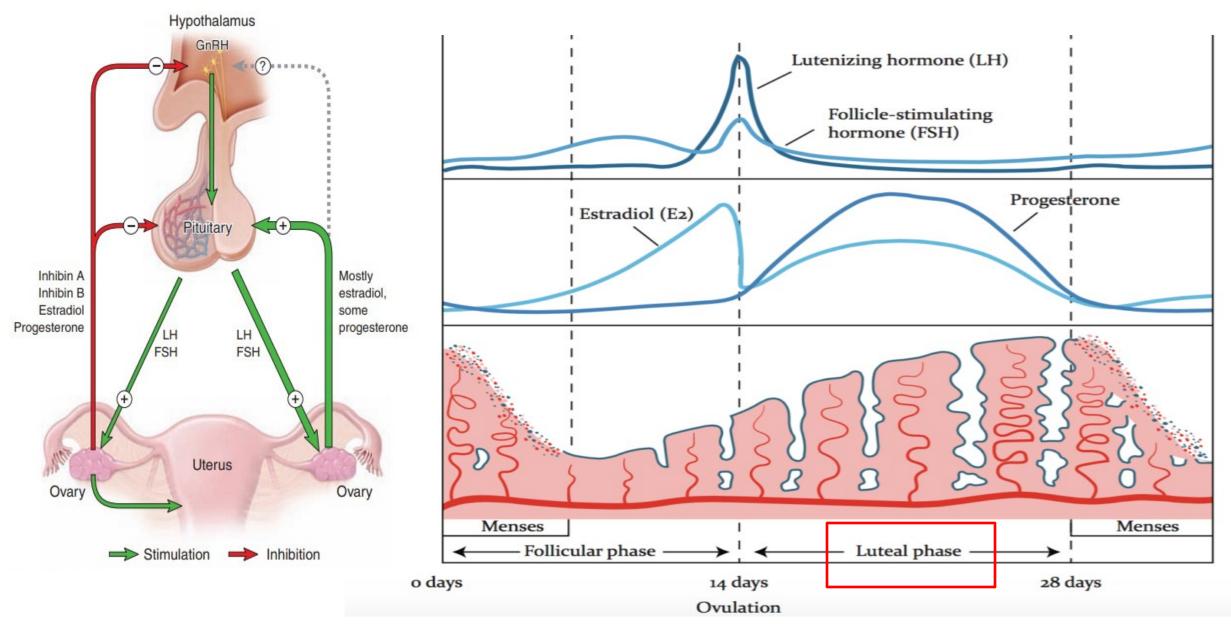

OBJECTIVES

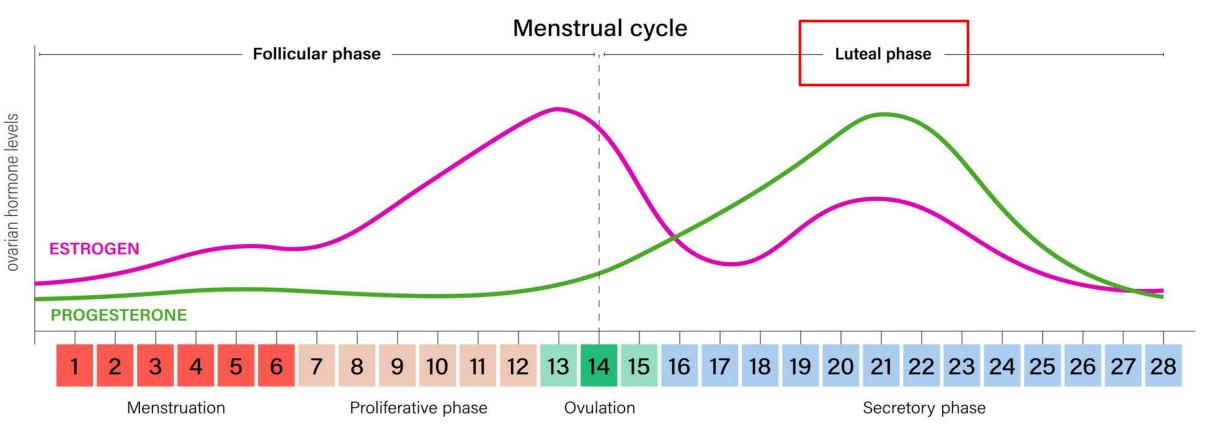

- 1. To address 3 common misconceptions about premenstrual mood syndromes
- 2. To distinguish clinical features of premenstrual syndrome, premenstrual exacerbation, and premenstrual dysphoric disorder, and review how to identify each in clinical practice
- 3. To summarize existing evidence for treatment of premenstrual dysphoric disorder

BACK TO BASICS: THE MENSTRUAL CYCLE

MISCONCEPTION 1: PREMENSTRUAL MOOD SYMPTOMS ARE THE RESULT OF HORMONAL IMBALANCES

It is not absolute levels of hormones, but sensitivity to normal hormonal fluctuations that incurs susceptibility to mood changes

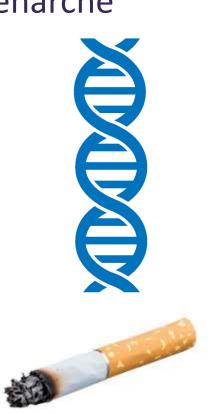

MISCONCEPTION 2: IT'S JUST "PMS" AND IT'S ALL THE SAME

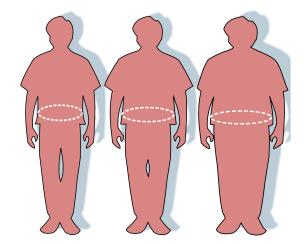

- 80-95% of women experience premenstrual physical and emotional symptoms
- 3 Types:
 - Premenstrual Syndrome (PMS): pattern of symptoms, occurs in 5 days prior to menses in at least 3 consecutive cycles and resolves with menstruation
 - Premenstrual Exacerbation (PME): Exacerbation of underlying psychiatric illness during luteal phase
 - Premenstrual Dysphoric Disorder (PMDD): DSM-5 diagnosis, at least 5 symptoms present in final week before onset of menses and become minimal or absent in the week post-menses, cause significant distress or interference in functioning

EPIDEMIOLOGY

- PMDD ~ 6.4%, onset near age of menarche
- Risk Factors:
 - -Genetics: BDNF, ESR1+2, SERT
 - -Metabolic Syndrome
 - -Diet
 - -Nicotine use
 - -Hx of trauma

SCREENING AND DIAGNOSIS OF PMDD

- Retrospective report is time-efficient, most accurate is prospective symptom tracking
 - Premenstrual Assessment Form
 - Premenstrual Symptoms Screening Tool
 - -*Daily Record of Severity of Problems (DRSP)
 - -*Prospective Rating of the Impact and Severity of Menstruation (PRISM)
- Diagnostic Criteria
 - Mood symptoms that cause functional impairment
 - 5 or more symptoms beginning during luteal phase, minimal or absent during follicular phase
 - Prospective mood tracking during at least 2 menstrual cycles

PROSPECTIVE DAILY MOOD LOGS

DSM-5 CRITERIA FOR PMDD

Table 2. Diagnostic Criteria for Premenstrual Dysphoric Disorder

- A. In the majority of menstrual cycles, at least five symptoms must be present in the final week before the onset of menses, start to improve within a few days after the onset of menses, and become minimal or absent in the week postmenses.
- B. One (or more) of the following symptoms must be present:
 - 1. Marked affective lability (e.g., mood swings; feeling suddenly sad or tearful, or increased sensitivity to rejection).
 - 2. Marked irritability or anger or increased interpersonal conflicts.
 - 3. Marked depressed mood, feelings of hopelessness, or self-deprecating thoughts.
 - 4. Marked anxiety, tension, and/or feelings of being keyed up or on edge.
- C. One (or more) of the following symptoms must additionally be present, to reach a total of five symptoms when combined with symptoms from Criterion B above.
 - 1. Decreased interest in usual activities (e.g., work, school, friends, hobbies).
 - 2. Subjective difficulty in concentration.
 - 3. Lethargy, easy fatigability, or marked lack of energy.
 - 4. Marked change in appetite; overeating; or specific food cravings.
 - 5. Hypersomnia or insomnia.
 - 6. A sense of being overwhelmed or out of control.
- 7. Physical symptoms such as breast tenderness or swelling, joint or muscle pain, a sensation of "bloating," or weight gain. NOTE: The symptoms in Criteria A–C must have been met for most menstrual cycles that occurred in the preceding year.
- D. The symptoms are associated with clinically significant distress or interference with work, school, usual social activities, or relationships with others (e.g., avoidance of social activities; decreased productivity and efficiency at work, school, or home).
- E. The disturbance is not merely an exacerbation of the symptoms of another disorder, such as major depressive disorder, panic disorder, persistent depressive disorder (dysthymia), or a personality disorder (although it may co-occur with any of these disorders).
- F. Criterion A should be confirmed by prospective daily ratings during at least two symptomatic cycles. (NOTE: The diagnosis may be made provisionally before this confirmation.)
- G. The symptoms are not attributable to the physiologic effects of a substance (e.g., a drug of abuse, a medication, other treatment) or another medical condition (e.g., hyperthyroidism).

Reprinted with permission from the American Psychiatric Association. Diagnostic and Statistical Manual of Mental Disorders. 5th ed. Washington, DC: American Psychiatric Association; 2013:171-172.

MISCONCEPTION 3: THE TREATMENT IS BIRTH CONTROL

- First-line treatment for PMDD: SSRIs
 - -Decrease in serotonergic function during luteal phase
 - -Luteal-phase only dosing comparative efficacy to continuous dosing
 - -Some evidence for SNRIs and TCAs
- Hormonal Interventions
 - -OCPs: *Drospirenone
 - -GnRH Agonists, Spironolactone
- Non-pharmocological

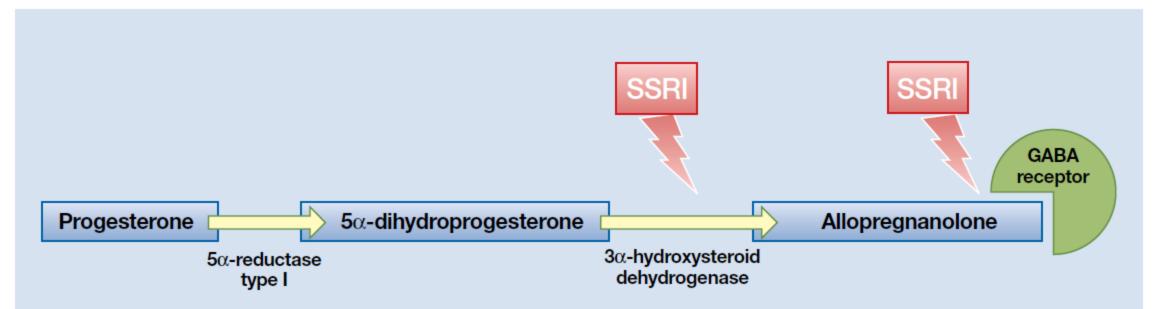

WAIT- HOW CAN SSRIS WORK THIS WAY?

- Usually, there is a 4-6 week delay between initiation of treatment and clinical response in MDD
- Patients with PMDD respond much more quickly, within days, suggesting a different pathophysiology
 - -SSRIs increase synthesis of allopregnanolone
 - Estrogen-serotonin interactions
 - -Genetics and heritability (ESR1), brain structure and function, and HPG axis

Conversion of progesterone to ALLO and the SSRI influence

SSRIs enhance the sensitivity of GABA_A receptors or promote the formation of more ALLO as shown here. This is one possible mechanism by which they could be helping to alleviate PMDD symptoms.

ALLO: allopregnanolone; GABA: γ-aminobutyric acid; PMDD: premenstrual dysphoric disorder; SSRI: selective serotonin reuptake inhibitor

HORMONAL INTERVENTIONS

- Oral Contraception
 - FDA-Approved OCP containing drospirenone
 - Risks: Thromboembolism

- Recommended for patients also intending to take them for contraception
- GnRH Agonists (Leuprolide, Goserelin)- for treatment-resistant cases only
- Danazol, Spironolactone, Bromocriptine and Cabergoline

NON-PHARMACOLOGICAL TREATMENTS

- Behavioral
 - -CBT
 - Mindfulness-based stress reduction
- Lifestyle Modifications
 - Minimize caffeine, salt, and alcohol
 - Optimize sleep and exercise
 - Scheduling changes that reduce stress during the premenstrual week(s)
- Supplements: Calcium, Vitamin E
- Surgical Oophorectomy as last-line treatment

SUMMARY

- Misconception 1: Premenstrual mood symptoms are the result of hormonal imbalances → It is not absolute levels of hormones, but sensitivity to normal hormonal fluctuations that incurs susceptibility to mood changes
- Misconception 2: It's just "PMS" and it's all the same → There are key clinical distinctions between premenstrual syndrome (PMS), premenstrual exacerbation (PME), and premenstrual dysphoric disorder (PMDD)
- Misconception 3: The treatment for PMDD is birth control → First-line treatment is SSRIs (continuous, luteal phase, or symptom-onset dosing), though can consider OCPs for contraception or for treatment-resistant cases
